

Peace – I noticed a few things during a trading session, so I worked with Luxalgo – Quant to add all times frames to the alerts, and CISD labels improvement according to the trade session that is selected in the settings.

Cool. Here is the Luxalgo description of our chat. Peace.

Here is a summary of the adjustments we made to the indicator to better support your mechanical trading process for Gold Futures (9 EMA Retrace & CISD):

MFB - Levels Coherence Indicator (Gold OR) - Updates

1. Unrestricted CISD Identification at Key Levels

- **The Adjustment:** The 5m CISD (Change in State of Delivery) logic was decoupled from session constraints and the 12-point confluence rule. It now actively monitors for sweeps at *all* defined key levels (Daily, Weekly, Monthly, Asia, London, 15m/30m/1h ORs).
- **The Process:** This ensures a purely mechanical approach. Whenever price sweeps a key level and then closes back inside, the CISD setup is immediately primed for a reversal signal, regardless of the time of day. This captures critical liquidity grabs across all sessions without arbitrary filtering.

2. Timeframe-Agnostic Signal Generation & Alerts

- **The Adjustment:** Hardcoded timeframe restrictions (like `is_5m`) were removed from both the CISD and 9 EMA Retrace execution variables.
- **The Process:** The indicator is now fully adaptable. Alerts and visual signals for both CISD and 9 EMA Retraces will trigger based on the chart's active timeframe. If you are tracking the 9 EMA on a 1m chart or a 5m chart, the mechanical rules apply seamlessly to the timeframe you are trading, allowing for dynamic entry execution across multiple timeframes.

3. Enhanced Visual Clarity (CISD Labels)

- **The Adjustment:** The visual markers for CISD signals were upgraded from basic diamonds to prominent, solid-colored labels (shape.labelup and shape.labeldown with white text).
- **The Process:** "The Process is the peace." Trading mechanically requires immediate, unambiguous visual confirmation. The new labels stand out sharply against the chart background and clearly point to the triggering candle, removing any guesswork or hesitation when reading the chart in real-time.

These updates streamline the indicator, ensuring it acts as a strict, rule-based tool for identifying liquidity sweeps (CISD) and trend continuation (9 EMA) in the Gold Futures market.

Peace -
