

MFB - Order Flow 7

MFB - Order Flow 7 is a 5-minute footprint indicator designed to measure cumulative delta after price interacts with important market structure levels.

It monitors automatic levels including:

- Previous Day High and Low
- Previous Week High and Low
- Asia session High and Low
- London session High and Low
- Initial Balance High and Low

After price touches one of these key levels, the indicator counts the next seven completed 5-minute footprint candles and adds their delta together.

It then prints a compact reading beneath the key level:

- **Negative Delta** — Check for Bullish 15-minute CISD structure.
- **Positive Delta** — Check for Bearish 15-minute CISD structure.
- **Balanced Delta** — Allow 15-minute structure to provide the primary context.

The indicator uses TradingView's native footprint data, excludes the touch candle itself, and requires valid footprint data for all seven candles. It is designed to provide focused order-flow awareness at meaningful key levels without generating automatic trade signals.

Peace -
