

MFB - Order Flow 7

MFB - Order Flow 7 is a 5-minute footprint assistant designed to support traders who cannot watch the chart continuously.

When price touches an important key level—such as PDH, PDL, PWH, PWL, Asia High/Low, London High/Low, or Initial Balance High/Low—the indicator counts the next seven completed 5-minute footprint candles and measures their cumulative Delta.

It then classifies the result as:

- **Negative Delta**
- **Positive Delta**
- **Balanced Delta**

The alert or chart reading provides a simple framework to check:

Reversal context

- Negative Delta at a low-side key level → Check for a **15-minute Bullish CISD**
- Positive Delta at a high-side key level → Check for a **15-minute Bearish CISD**

Continuation context

- 15-minute bullish closure/displacement above a key level plus Positive Delta → Check for a **5-minute Bullish FVG-123**
- 15-minute bearish closure/displacement below a key level plus Negative Delta → Check for a **5-minute Bearish FVG-123**

If Delta conflicts with the breakout direction, or is Balanced, the reading advises waiting and relying on structural confirmation.

The indicator is designed as an **awareness and confirmation assistant**, not an automatic trading system. It does not place trades or independently

recommend entries, direction, position size, or risk levels. Its purpose is to help a busy trader quickly understand:

Where price is, what order-flow effort occurred, and which MFB structural framework to check next.

Peace.
