

Peace – Here is a Luxalgo – Quant description –

Universal MFB – Gold Session is meant to work well with the “**Momentum Flow Build w/FVG v6 (clean)**” indicator that draws all key levels.

Universal MFB – Gold Session helps you focus on one important question:

Which liquidity level has already been taken, and which level is still untouched?

It is designed for the 5-minute COMEX Gold session, especially the 8:20–9:30 AM New York window.

How to read it

1. O.W.L. label appears

- This means the Asia High or Asia Low has not yet received a confirmed Sweep FVG-123.
- O.W.L. means Opportunity With Liquidity.

2. Price reaches the O.W.L. level

- This is a liquidity-touch event.
- It tells you price has arrived at the level, but it is not necessarily an entry signal yet.

3. Sweep FVG-123 confirms

- Price first interacts with the unswept level.
- A Fair Value Gap forms.
- Price returns to the FVG.

- A confirming close through the FVG boundary produces the reversal signal.

Simple directional interpretation

- Asia Low has been swept: Asia High may become the remaining upside liquidity target.
- Asia High has been swept: Asia Low may become the remaining downside liquidity target.
- Both sides have been swept: Stand aside because the session may become choppy.
- Neither side has been swept: Wait for COMEX price behavior to reveal the direction.

PDH and PDL add confluence when they are close to the remaining Asia liquidity level.

Best Alert to Use

For the main actionable signal, use:

Unmitigated Sweep FVG-123

This is the best general alert because it triggers only after an unswept Asia liquidity level receives a confirmed reversal-style Sweep FVG-123.

You can also use the more specific alerts:

- Unmitigated Asia High Sweep FVG-123
- Unmitigated Asia Low Sweep FVG-123

The COMEX touched unmitigated Asia High/Low alerts are earlier warnings, but they only mean price reached the level. They do not confirm that the reversal is ready.

A practical alert sequence is:

1. O.W.L. available — identifies the untouched liquidity.

2. COMEX touched unmitigated Asia High/Low — price reached the level.
3. Unmitigated Sweep FVG-123 — reversal confirmation.

No alert should replace risk management or confirmation from the live price action.

Why Universal MFB – Gold Session Brings More Peace to Trading

Universal MFB – Gold Session helps turn the COMEX open into a focused decision window instead of an all-day search for trades. It organizes the session around what liquidity has already been swept and what remains untouched, using **O.W.L. — Opportunity With Liquidity** — to highlight the key level still available for price to seek.

By focusing on the 8:20–9:30 AM New York window, Asia High/Low, PDH/PDL confluence, and confirmed reversal signals such as Sweep FVG-123 and CISD, the indicator encourages patience and selectivity. If both sides have been taken, there is no need to force a trade. If neither side has been taken, the trader can simply wait for price to reveal its intention.

The result is a calmer process: know what has been mitigated, know what remains, wait for confirmation, and accept that sometimes the best trade is no trade.

Peace -
