

MFB - Order Flow 7

MFB - Order Flow 7 is a 5-minute footprint indicator that helps traders read order flow after price interacts with important market structure levels.

It automatically monitors:

- Previous Day High and Low
- Previous Week High and Low
- Asia Session High and Low
- London Session High and Low
- Initial Balance High and Low

When price touches one of these key levels, the indicator excludes the touch candle and measures the cumulative delta of the next seven completed 5-minute footprint candles. It then displays a compact order-flow reading beneath the relevant key level.

How to interpret the readings

- **Negative Delta**
Look for potential bullish absorption, rejection, or exhaustion around the key level. This can provide additional confidence when evaluating a bullish 15-minute CISD, FVG reaction, or reversal setup.
- **Positive Delta**
Look for potential bearish absorption, rejection, or exhaustion around the key level. This can provide additional confidence when evaluating a bearish 15-minute CISD, FVG reaction, or reversal setup.
- **Balanced Delta**
Order flow is not providing a strong directional bias. Allow price structure, liquidity, displacement, CISD, and FVG behavior to provide the primary context.

The indicator can be used for both **reversal and continuation setups**. At a key level, the reading may help determine whether opposing order flow is being absorbed or whether the level is supporting a directional move. This information can also help increase confidence in a CISD or FVG that forms away from the original key level, provided the broader market structure and directional narrative remain aligned.

For example, a strong order-flow reaction at a previous-day level may support a later CISD or FVG entry that forms several candles away from that level. The indicator is therefore intended as contextual confirmation—not as an automatic entry or exit signal.

MFB - Order Flow 7 uses TradingView's native footprint data, requires valid footprint information for all seven measured candles, and is designed to provide focused order-flow awareness at meaningful market structure levels.

Always combine the reading with price action, liquidity, displacement, market structure, and risk management.
