TradingView

I also put the TradingView **Fixed Range Volume Profile** on the MNQ chart from **yesterday's 9:30am to 4pm**, because it's a clean picture of HVN and LVN – (High Volume Node and Low Volume node)

Here is a description of this picture from SmarttraderAI – peace

"Price opened above Value Range = Bullish reading" Spot on. When price opens above the previous day's VAH, the market is in a state of imbalance — outside of accepted value. That leans bullish because participants are signaling they're willing to accept higher prices. The framework is clear: open above VAH = trending/bullish condition. You're reading it correctly.

✅ **"POC is above midline = Bullish reading"** Correct. When the POC sits in the upper half of the value range (above the VA Mid), it tells you that the highest concentration of volume traded in the upper portion of the distribution — buyers have been more dominant within that range. That's a bullish lean.

✅ **"Higher volume = more resistance here"** Solid. High Volume Nodes (HVN) are equilibrium zones — that's where price tends to slow down, chop, or reverse. Identifying these ahead of time is exactly how you avoid getting caught in stall zones. Good awareness.

✅ **"Path of least resistance"** The arrow pointing upward toward the lower-volume area makes sense given the bullish context. Low volume nodes tend to act like doorways — price can move through them faster with less fight.
