

Welcome to the new MFB - Order Flow 7

MFB - Order Flow 7 helps you observe how **price movement and aggressive order flow** behave around important key levels, such as previous-day and previous-week highs/lows, session highs/lows, and the Initial Balance.

When price reaches an enabled key level, the indicator compares price progress with cumulative footprint delta over your selected number of completed 5-minute candles. **Agreement** means price and order flow moved in the same direction; **divergence** means they moved in opposite directions. The active level is identified in the reading, and the reading clears when price moves beyond the configured active distance.

Use the result as **awareness—not a buy or sell signal**. Agreement can help you watch for a close and retest/hold; divergence can prompt you to watch for reversal structure, such as a CISD. Wait for price structure to confirm rather than trading the delta reading alone.
