

## MFB - One Minute Chart — 1 min Beginner's Description

- Welcome to **MFB - One Minute Chart**. This indicator looks for potential trading setups around key price levels, market structure shifts, fair value gaps (FVGs), and the 9/20 EMA trend. It provides two combined alert setups:
- **“Any Key-Level Arrow + FVG/9-20 Confirmation”** — A trend-following setup: a key-level sweep and structure shift align with the 9/20 EMA trend, while price respects a matching FVG and closes in the trend direction. This confluence supports a possible continuation, but cannot guarantee one.
- **“Any FVG-123 after Key-Level Touch + 9/20 EMA Cross”** — A possible reversal or transition setup: after price reaches a key level, the EMA cross signals a potential directional shift; an FVG retest and breakout close provide further confirmation.
- Both are rule-based setups—not guarantees of profitable trades. Alerts are notifications only and do not place orders.

Trade signal example:

**The “Arrow” LONG marker corresponds to its **bullish pivot-sweep followed by a market-structure shift (MSS)** setup**

In plain terms: price first ran below a prior swing low and closed back above it, then later closed through a nearby swing high. The idea is that the downside liquidity grab was rejected and price then showed short-term bullish structure.

### **New indicator improvements—beginner’s guide**

- **9–10 AM ET range:** The indicator tracks the high and low made between 9:00 and 10:00 AM New York time, then draws them as red horizontal lines until 1:00 PM ET. The timing adjusts for daylight saving changes.
- **15m REV:** A 15-minute candle wicks beyond a key level, then closes back inside it. This can indicate a possible rejection or reversal.
- **15m BRK:** A confirmed 15-minute candle closes across a key level—above a high or below a low. This highlights a possible breakout, but **does not require a later retest**.
- **Key-level context:** The 15-minute signals can use enabled daily, weekly, Asia, London, and 9–10 AM range levels.

**15-Minute CISD with 9/20 EMA Alignment:** On each confirmed 15-minute candle close, the indicator checks enabled key levels:

Prior-day and prior-week highs/lows, completed Asia and London highs/lows, and the completed 9:00–10:00 AM ET range.

A bullish setup qualifies only when the 15-minute 9 EMA is above the 20 EMA; a bearish setup qualifies only when the 9 EMA is below the 20 EMA.

The EMA test is their relative position at the candle close—it does not require price to close beyond the 9 EMA or require the EMAs to be sloping.

On the 15-minute chart, qualified setups can show a CISD marker and 1:1 entry, stop, and target guides.

The entry is the signal candle's close; the stop is one tick beyond its low for bullish setups or high for bearish setups, and the target is one equal-risk unit away.

The separate **One Chart agreement HTF/LTF** alert additionally requires a same-direction 1-minute entry signal at the 15-minute close.

Peace
