

MFB Indicator Team - One Chart Trading Plan

The trading plan is based on proven "Funded trader" strategies.

If/Then Framework

IF - Key level

THEN - Structural Evidence

I.A.M. working with multiple MFB indicators, because of diverse strategy strengths.

The "One Chart" focus is the **1 minute chart** only, because all responses to key levels, value range and opening range considerations have been programmed into the indicators respectively.

Trading Times I am letting the indicator scan on:

Primarily the NY EST – **10am to 12pm**

- if trading Asia session – 9pm to 10:30pm (11pm)

Indicator list:

1) **Momentum Flow Build w/ FVG v6 (clean)** for key level locations awareness.

2) **MFB - Universal I.B.**

- for "Flow" trade setups at key levels and opening ranges.

A **Flow FVG-123** requires:

- Price to touch a monitored key level before the FVG is created.
- Price to continue through and beyond the displaced level.
- The entire FVG to form beyond that level.
- Price to retest the FVG and then break out in the direction of continuation.

Initial Balance levels:

- **Asian Initial Balance:** 6:00–7:00 PM
- **London Initial Balance:** 12:00–1:00 AM
- **New York Initial Balance:** 9:30–10:30 AM

*The Initial Balance levels represent the opening range **where liquidity can be formed or manipulated**. Once that range or another key level is displaced, the subsequent directional move may represent the Distribution phase.*

*The “MFB – Universal I.B.” script does not explicitly classify Q2 Manipulation or Distribution as separate market phases. Instead, **it identifies the price behavior** associated with that idea: key-level interaction, displacement, confirmation, and continuation or reversal.*

3) "MFB - Value Acceptance"

This indicator draws the 9/20 EMA and VWAP, as well as RSI Divergence for added trading session support.

4) MFB - Value Reading Session

This indicator draws the previous day's **New York Fixed Range Volume Profile** as a guide for Value range readings.

If price opens outside the VAH or VAL, then there is potential expansion (direction) for the day, because price was **Accepted** beyond value.

If price opens within the value range (it indicates that Value found "**Balance**"), and the trading day may tend towards “chop, rotation between VAH/HAL or have “false signals”.

(Some people like to trade the rotation between VAH or VAL with POC as a Target on a "Balanced" Value day, or not trade that day.)

Here are **Four Trading scenarios** if a person is specifically interested in “Value Range” discretionary concepts as it relates to **“Time Based Liquidity”** (Asia/London/NY key levels):

A **Universal Framework** way to remember the 4 scenarios is:

Value (Awareness) –

Level (Key level) –

Structure (Structural Evidence) –

Entry -

V.L.S.E.

A) Value Reversal (“failed auction”)

TBL near VAH/VAL (Confluence).

Structural Evidence: Liquidity Sweep → 15-minute CISD → Return into Value.

Trade Entry: Confirmed 15-minute CISD close or predetermined retracement (5-minute confirmation or 1-minute FVG-123).

Stop Loss: Beyond liquidity sweep extreme.

Potential Target: POC or next opposing liquidity level.

B. Value Continuation

TBL near VAH/VAL (Confluence).

Structural Evidence: Break beyond TBL and Value Boundary → Acceptance → Retest.

Trade Entry: Confirmed retest or FVG-123 continuation in the direction of acceptance.

Stop Loss: Beyond protected retest swing.

Potential Target: POC when accepting into value, or next external liquidity level when accepting outside value.

C. Independent TBL Reversal

TBL not in proximity confluence with VAH/VAL.

Structural Evidence: Liquidity Sweep of TBL → 15-minute CISD reversal.

Trade Entry: Confirmed 15-minute CISD close or predetermined retracement (5-minute confirmation or 1-minute FVG-123).

Stop Loss: Beyond liquidity sweep extreme.

Potential Target: Next opposing TBL or Value Area boundary.

D. Independent TBL Continuation

TBL not in proximity confluence with VAH/VAL.

Structural Evidence: Break beyond TBL → Acceptance → Retest.

Trade Entry: Confirmed retest or FVG-123 continuation in the direction of acceptance.

Stop Loss: Beyond protected retest swing.

Potential Target: Next liquidity objective in the direction of continuation.

Trading Framework:

SESSION → VALUE AWARENESS → TBL LOCATION → CONFLUENCE
EVALUATION → STRUCTURAL EVIDENCE → TRADE ENTRY.

Guiding Principle: Value provides Awareness. TBL provides Location. Proximity establishes Confluence. The completed 15-minute CISD or Acceptance/Retest provides Structural Evidence. Entry follows the confirmed trade thesis.

Note: Confluence and independent TBL setups are separate classifications. A confluence reversal may represent a return into value or rejection away from value, depending on which boundary is involved. All four scenarios require backtesting before treating them as validated trading setups.

5) **MFB- One Chart - 1 minute**

Higher Time Frame (HTF) and Lower Time Frame (LTF) agreement.

This indicator alerts trade setups when there is key level response, expressed through a **15 minute CISD with 1 minute** sweep 9/20 EMA cross and Market Structure Shift (or FVG-123).

Alerts set on indicators are as follows:

MFB – One Chart – 1 min indicator:

One Chart Agreement HTF/LTF

15 min CISD + 1 min Sweep/Arrow Agreement

15 min CISD w? 1 min FVG-123 9-20 EMA

MFB – Universal I.B. indicator:

Any I.B. Key level response

I.B. CISD + Key level FVG

FVG-123 Key level setup

The MFB trading plan rooted sessions will be A **“Process is the Peace”** production (Patience is the EDGE), and the **“Continuous Improvement” motivations** (based on “Probabilistic Mindset” and “Inner Game of Tennis” peace philosophy) will be processed through chats with SmartTraderAI.

Peace.
