Indicator description

MFB – 15min Accept-Rev-FVG evaluates completed 15-minute candles at key reference levels: prior-day and prior-week highs/lows, Asia, London and New York session and initial-balance levels, plus optional manual VAH/VAL.

It labels **ACCEPTANCE** when price decisively closes through a level, and **REVERSAL** when price sweeps beyond a level and reclaims it. Optional confirmation filters wait for follow-through on Acceptance or a CISD-style close on Reversal. The default one-per-move filter reduces repeated Acceptance labels. Fifteen-minute FVGs are not shown as separate signals; a same-direction FVG can serve as an internal Acceptance confirmation.

Why wait for the 15-minute close?

Waiting lets the candle finish telling its story: where it closed, how decisive the move was, and whether price truly reclaimed or held beyond the level. That can help filter out brief intrabar breaks and wick-driven noise, while the follow-through checks add another layer of confirmation.

The trade-off is that signals arrive later and some early movement may already have happened. The indicator evaluates completed 15-minute candles even when viewed on a lower timeframe; it can filter signals, but it cannot guarantee what price does next.

Peace -
