

check parity, 4 hour, 1 hour, 30 min, 15, 1 min

what are dominant impulses

We need strong impulses <sup>(larger)</sup> to show us sentiment, that should be the same as the overall trend ("prevailing" trend) minimum 3 or less candles in recent moves. <sup>(short)</sup>

\* in smaller time frames we need lower highs, lower lows etc to confirm - - -

EMA's should be proper order in 1 hour.

4 hour and supply demand pockets

Remember that impulses have to correct, so if as: uptrend higher lows, higher highs → then wait for MBO (for resistance to break after pullback)

(how far away is consolidation) (retests) this can tell us where we are in ~~consolidation~~ <sup>in</sup> ~~retests~~ <sup>fibonacci analysis</sup> about imbalance. (Elliot wave)

Mark all price turns, its either supply or demand C.T. = 3 up, 2 down or 2 up, 1 down

ex: where did buyers stop recently look over - uptrend 

our path of least resistance has areas to go through (what are these areas?) (price turns, ed impulses origination)

we must mark (check left) previous strong impulses from before that may go against our path of least resistance.

Trending, ranging, consolidating?

Again, once our path of least resistance breaks an opposite sentiment price turn, we must check left for speed pumps or clusters of the opposite sentiment. (any recent rev. patterns?)

Large impulse, start measuring the move ("measured move") (remember 1 hour then 15 min is good for momentum)

② So are we in the 3 up or 2 down

this is also aggregate too.

Remember parabolic principle --- what goes up fast will go back the other way.

Remember  previous resistance is good support (check overall trend though)

Is there room in our 1 hour for 4 hour or 1 hour price movement before the next opposing force to our momentum direction.

(check 15 minute for recent speed bumps and resistance to our path of least resistance)

our targets are the areas of resistance, and our protective stops will be the recent pull back area with enough room that the position would stop out

Always check and recheck EMA's in 1 hour, 30, 15, 5, 1

EMA is our fuel (and after opening a position we can monitor in 5 minute so when a price struggle happens we can relax)

Impulsions of 30 pips or more in 15 min is good... (always with prevailing trend, because Forex likes to trend and with great magnitude)

\* Remember that price turns in Daily and 1 hour are very important levels. as well as origination of impulsion strength  
↳ "Enjoy the discovery"

This is price based trading and we can add techniques to increase probability. stacking probabilities
